

Peru's Oligarchy Overthrows President Castillo

Manolo De Los Santos

June 6, 2021, was a day which shocked many in Peru's oligarchy. Pedro Castillo Terrones, a rural schoolteacher who had never before been elected to office, won the second round of the presidential election with just over 50.13% of the vote. More than 8.8 million people voted for Castillo's program of profound social reforms and the promise of a new constitution against the far-right's candidate, Keiko Fujimori. In a dramatic turn of events, the historical agenda of neoliberalism and repression, passed down by former Peruvian dictator Alberto Fujimori to his daughter Keiko, was rejected at the polls.

From that day on, still in disbelief, the Peruvian oligarchy declared war on Castillo. They made the next 18 months for the new president a period of great hostility as they sought to destabilize his government with a multi-pronged attack that included significant use of lawfare. With a call to "throw out communism," plans were made by the oligarchy's leading business group, the National Society of Industries, to make the country ungovernable under Castillo.

In October 2021, recordings were [released](#) that revealed that since June 2021, this group of industrialists, along with other members of Peru's elite and leaders of the right-wing opposition parties, had been planning a series of actions including financing protests and strikes. Groups of former [military](#) personnel, allied with far-right politicians like Fujimori, began to openly call for the violent overthrow of Castillo, threatening government officials and left-leaning journalists.

The right-wing in Congress also joined in these plans and attempted to impeach Castillo on two occasions during his first year in office. “Since my inauguration as president, the political sector has not accepted the electoral victory that the Peruvian people gave us,” Castillo [said in March](#) 2022. “I understand the power of Congress to exercise oversight and political control, however, these mechanisms cannot be exercised by mediating the abuse of the right, proscribed in the constitution, ignoring the popular will expressed at the polls,” he stressed. It turns out that several of these lawmakers, with support from a right-wing German foundation, had also been [meeting](#) regarding how to modify the constitution to quickly remove Castillo from office.

The oligarchic rulers of Peru could never accept that a rural schoolteacher and peasant leader could be brought into office by millions of poor, Black, and Indigenous people who saw their hope for a better future in Castillo. However, in the face of these attacks, Castillo became more and more distanced from his political base. Castillo formed four different cabinets to appease the business sectors, each time conceding to right-wing demands to remove leftist ministers who challenged the status quo. He [broke](#) with his party Peru Libre when openly challenged by its leaders. He [sought](#) help from the already discredited Organization of American States in looking for political solutions instead of mobilizing the country’s major peasant and Indigenous movements. By the end, Castillo was fighting alone, without support from the masses or the Peruvian left parties.

The final crisis for Castillo broke out on December 7, 2022. Weakened by months of corruption allegations, left infighting, and multiple attempts to criminalize him, Castillo was finally overthrown and imprisoned. He was replaced by his vice president, Dina Boluarte, who was sworn in after Congress impeached Castillo with 101 votes in favor, six against, and ten abstentions.

The vote came hours after he announced on television to the country that Castillo was dissolving Congress. He did so preemptively, three hours before the start of the congressional session in which a motion to dismiss him for “permanent moral incapacity” was to be debated and voted on due to allegations of corruption that are under investigation. Castillo also announced the start of an “exceptional emergency government” and the convening of a Constituent Assembly within nine months. He said that until the Constituent Assembly was installed, he would rule by decree. In his last message as president, he also decreed a curfew to begin at

10 o'clock that night. The curfew, as well as his other measures, was never applied. Hours later, Castillo was overthrown.

Boluarte was sworn in by Congress as Castillo was detained at a police station. A few demonstrations broke out in the capital Lima, but nowhere near large enough to reverse the coup which was nearly a year and a half in the making, the latest in Latin America's long history of violence against radical transformations.

The coup against Pedro Castillo is a major setback for the current wave of progressive governments in Latin America and the people's movements that elected them. This coup and the arrest of Castillo are stark reminders that the ruling elites of Latin America will not concede any power without a bitter fight to the end. And now that the dust has settled, the only winners are the Peruvian oligarchy and their friends in Washington.

The Global Push For Population Growth Shows We're Not Grappling With The Climate Crisis

Carter Dillard - Photo: YouTube

Progress is being undone by growth, especially as the climate crisis deepens.

In all of the news surrounding Vladimir Putin, it might have been easy to overlook that he had recently revived a Soviet-era policy [called the “Mother Heroine” award](#), which goes to women who bear 10 or more children, offering financial incentives and other benefits in a bid to spur population growth. He is not alone, with a host of men who perch atop pyramids of power—from [Elon Musk](#), to Iran’s Supreme Leader [Ayatollah Ali Khamenei](#), to Hungary’s strongman [Victor Orban](#)—pushing women to have children as a means of growing the base of those power pyramids and further elevating the men at the top.

Corporations in the U.S., through targeted media, push for the same by sensationalizing the idea of an [economic “baby bust”](#) that threatens the nation. Contrast the scant media coverage of studies showing the massive impact a universal ethic of [smaller families would have on the climate crisis](#), with the ubiquitous and not-so-stealthy [advertising](#) we see across popular media platforms. The rhetoric of the constant need for more workers, consumers, and taxpayers goes beyond just pushing women to have children and supports recent successful moves [to ban contraception and abortions](#).

It does not help that civil society organizations that purport to protect children, equity, animals, the environment, and human rights and democracy often ignore these issues, fearing the ugly framing of population issues from the past rather than pivoting towards the existential justice of socially and ecologically regenerative family reforms. In each one of these areas of need, progress is being undone by growth, especially as the climate crisis deepens.

Putin’s and others’ push for constant growth—and the silence of many nonprofits around the issue—reveals the lie at the base of the climate crisis: that population growth and the expansion of the Anthropocene is sustainable, or even desirable.

That lie is fundamental because it is existential, preceding more practical questions like how to limit emissions. The lie (and the growth it enables) is undoing attempts to limit emissions [as growth takes over](#). The lie encompasses an existential worldview that sees Earth as a human resource, children deserving of no particular level of welfare at birth (like those conditions that the United Nations [Children's Convention](#) purports to provide), treats being born crushingly poor or ultra-rich as an act of god rather than a product of inequitable family planning policy, and treats democracy as more of an abstract concept than an actual process whereby people meaningfully [influence the rules under which they are forced to live](#).

That population growth is not sustainable should be painfully obvious now, as the [population-driven climate crisis](#) unfolds, killing people worldwide in [unprecedented heat waves](#).

[Some push back](#) on the connection between population growth and the climate crisis, but these analyses mistake population growth as simply a matter of numbers. Population growth entails exacerbating the unjust power relations described above—between parents and their children, between rich and poor, between people and their political leaders, etc.—in which power flows top-down, rather than bottom-up, [as truly participatory human rights and democracy actually require](#). Population growth entails relatively few extracting wealth and power from the majority—again something that should be obvious as the ecological costs of our economic growth are slated to fall on the vulnerable majority: future generations.

Is growth, in and of itself, desirable?

Growth is enabled by not ensuring, through things [like family planning incentives](#), that all children have minimum levels of welfare. Is that desirable? Growth is enabled by [not ensuring children equal opportunities in life](#). Is that desirable? Growth is enabled by ignoring the value of participatory democracy and [scrapping any minimum level of connection](#) between democratic “representatives” and the people subject to their rules. Is that desirable?

The alternative to Putin's and others' pyramids—in which a few are empowered by disempowering the majority—involves reversing the flow of power, first and foremost by making family planning universally [a child-centric process](#). That move

makes us—in the most basic way—truly other-regarding, and changes the direction of power so that would-be parents are not lording over future generations and the ecologies of our planet, but working together to ensure all children are born in social and ecological conditions that satisfy the requirements of the Children’s Convention. That act—of becoming fundamentally other-regarding—enables us to physically [constitute future communities as free and equal people](#), the ideal of consensual governance that many theorists have envisioned but rarely achieved.

Child-centric planning is the epitome of shifting the flow of power from the powerful down upon the vulnerable—which enables exploitation—towards a flow from the vulnerable up to the powerful, aligning children’s interests in conditions of birth and development in which they will thrive, with women’s interest in the elimination of [life-hobbling pronatalism](#), with the average person’s interest in more equal opportunities in life as well as smaller and more functional democracies where the average person is actually empowered, with nonhumans’ interest in the restoration of nonhuman habitat, restorative environmentalism, and more empathetic persons inclined to treat animals well (what nonhumans value most of all).

We might be inclined to resist such radical reforms because the majority of people alive today would support them, and there are good [reasons to defer to the majority](#). Given that the majority of persons are actually those vulnerable-to-us people who will live in the future, and this work would be saving them from the tyrannical minority that is those people alive today inflicting harm on the future, you should think the opposite.

We can do this work because being free, in terms of who we are, precedes being free in terms of what we do—including forming governments to assign property to wealth that was made by externalizing costs, [by not giving mothers and kids what they need](#).

Free people will fundamentally limit and decentralize the power (including subtle power like climate emissions and the impact of bad parenting on communities) others have over them through Fair Start family reforms like [climate restoration](#) and [#birthequity baby bonds](#) to [physically constitute democracy and consensual governance](#) where people are actually empowered to make the ultimate rules under which all must live. And there is only really one way to do that: Parental

readiness policies that avoid things like parents [torturing their children to death](#), birth equity redistribution of wealth to [ensure true equality of opportunity](#), and a universal [ethic and default of smaller families](#).

Changing the flow of power in this way is fundamental, or existential, justice in action. It is the antithesis of Putin's move to grow and centralize Russian power by exploiting future generations (or the move Musk, Khamenei, or others are trying to make) and instead takes our most basic values and uses them to structure power relations for the future majority, ensuring that we begin to orient from a just and genuinely inclusive place.

Putin's policy shows us the lie, that growth is sustainable and desirable, at the base of the climate and so many other crises. The lie hides top-down power over the most vulnerable and has created the crises we face today. Let's unlearn that lie and reverse the flow.

Cuba Goes On A Diplomatic Tour In An Increasingly Multipolar

World

*Manolo De Los Santos -
Photo: Twitter*

On November 27 morning, Cuban President Miguel Díaz-Canel, [walked](#) into a voting station in the Playa neighborhood to vote in Cuba's municipal elections. He had [landed](#) in Havana an hour earlier from an intense tour of Algeria, Russia, Turkey, and China.

The tour, which [started](#) on November 16, was both a journey into the [past](#) of the nonaligned world that Cuba played an integral role in building and an essential step into the future toward the establishment of a multipolar world. Each stop also served as a reminder of the strong relationships based on cooperation and mutual respect that Cuba has been cultivating since [1959](#). Undoubtedly, the Cuban Revolution and its internationalism placed Cuba on the map and gave it an outsized role in world politics.

Yet this tour took place against a complex backdrop. The country's recent economic and financial situation has been [characterized](#) by crisis since the intensification of the United States blockade under former President Donald Trump and President Joe Biden, with the imposition of [243](#) unilateral sanctions and the inclusion of Cuba on the state sponsors of terrorism list. Add to this the impact of COVID-19 over the past three years, [several](#) natural disasters, and a [series](#) of unfortunate accidents that have negatively impacted Cuba.

Díaz-Canel also traveled abroad to explore with Cuba's strategic partners the state of multilateralism and development in a rapidly changing world in the wake of the war in Ukraine, NATO aggression, and the growing [fragility](#) of U.S.

hegemony. Cuba's [achievements](#) and potential, despite being besieged, served as the basis for discussions during the tour relating to areas of [mutual interest](#) such as renewable energy, biotechnology, health care, communications, and industry.

During the tour of these countries, several new agreements were signed that pointed to a desire to help Cuba. From [offers](#) of setting up renewable energy power plants to more regular oil shipments and plans to modernize Cuban industries, it's clear that Algeria, Russia, Turkey, and China do not want Cuba to fall under the weight of Washington's sanctions regime. "It is obvious that sanctions have an effect on the fact that our relations remain below their true potential," Turkish President Recep Tayyip Erdoğan [pointed](#) out during a press conference with his Cuban counterpart in Ankara on November 23.

This 11-day tour [ended](#) in China, where perhaps the most challenging yet essential [conversations](#) were held. Under the weight of an intensified U.S. blockade and severe limitations to its foreign currency reserves, Cuba has been unable to service its debt with China. "There is enormous sensitivity in the Chinese leadership, particularly in President Xi Jinping," [commented](#) Díaz-Canel afterward. "There is an express will in him, even with indications in official talks, that a solution must be found to all of Cuba's problems, regardless of the problems with the debt." Against the United States' efforts to restrain Cuba, Díaz-Canel asserted how China is "betting on the development of the country based on the cooperation that they can give us."

Is Russia Really The Reason Why Mali Continues To Push France Away?

Vijay Prashad

On November 21, 2022, Mali's interim Prime Minister Colonel Abdoulaye Maïga posted a [statement](#) on social media to say that Mali has [decided](#) "to ban, with immediate effect, all activities carried out by NGOs operating in Mali with funding or material or technical support from France." A few days before this statement, the French government cut official development assistance (ODA) to Mali because it believed that Mali's government is "allied to Wagner's Russian mercenaries." Colonel Maïga [responded](#) by saying that these are "fanciful allegations" and a "subterfuge intended to deceive and manipulate national and international public opinion."

Tensions between France and Mali have increased over the course of 2022. The former colonial power [returned](#) to Mali with a military intervention in 2013 to combat the rise of Islamist insurgency in the northern half of Mali; in May 2022, the military government of Mali [ejected](#) the French troops. That decision in May came after [several months](#) of accusations between Paris and Bamako that mirrored the rise of anti-French [sentiment](#) across the Sahel region of Africa.

A new burst of anti-colonial feeling has swept through France's former colonies, where the debates are now centered around breaking with France's stranglehold on their economies and ending the military intervention by French troops. Since 2019, the countries that are part of the [West African Economic and Monetary Union](#) and the [Economic and Monetary Community of Central Africa](#) have been slowly withdrawing from French control over their economies (for example, in 2020, the French officially [announced](#) that for West Africa, it would end the requirement for countries to deposit half their foreign exchange reserves with the French Treasury through the old colonial instrument of the CFA franc). According to a [story](#) that circulated in West Africa and the Sahel—given credence by an email sent by an “unofficial adviser” to former U.S. Secretary of State Hillary Clinton—one of the reasons why France's then-president Nicolas Sarkozy wanted to overthrow Libya's Muammar Gaddafi in 2011 was because the Libyan leader had proposed a new African currency instead of the CFA franc.

France denies that the reason for this tension with Mali is due to the new anti-colonial mood. The French government says that it is entirely due to Mali's [intimacy](#) with Russia. Mali's military has increasingly been establishing closer ties with the Russian government and military. Mali's Defense Minister Colonel Sadio Camara and Air Force Chief of Staff General Alou Boï Diarra are [considered](#) to be “the architects” of a deal made between the Malian military and the Wagner group in 2021 to [bring](#) in several hundred mercenaries into Mali as part of the campaign against jihadist groups.

Wagner soldiers are in Mali, but they are not the cause of the rift between Paris and Bamako. The anti-colonial temper predates the entry of Wagner, which France is using as an excuse to cover up its humiliation.

‘The Ax Always Falls On The Most Vulnerable’: Pakistan Demands Debt Cancellation And Climate Justice

Photo: Peoples Dispatch

More than 1,700 people have been killed in floods that continue to submerge parts of Pakistan. Amid this crisis, activists are demanding debt cancellation and climate reparations.

Even as the floodwaters have receded, the people of Pakistan are still trying to grapple with the death and devastation the floods have left in their wake.

The floods that swept across the country between June and September have [killed](#) more than 1,700 people, injured more than 12,800, and [displaced](#) millions as of November 18.

The scale of the destruction in Pakistan was still making itself apparent as the world headed to the United Nations climate conference COP27 in Sharm el-

Sheikh, Egypt, in November. Pakistan was one of two countries [invited](#) to co-chair the summit. It also [served](#) as chair of the Group of 77 (G77) and China for 2022, playing a critical role in ensuring that the [establishment](#) of a loss and damage fund was finally on the summit's agenda, after decades of resistance by the Global North.

"The dystopia has already come to our doorstep," Pakistan's Minister for Climate Change Sherry Rehman [told](#) Reuters.

By the first week of September, pleas for help were giving way to [protests](#) as survivors, living under open skies and on the sides of highways, were dying of [hunger](#), [illness](#), and lack of [shelter](#).

Parts of the Sindh province, which was hit the [hardest](#), including the districts of Dadu and Khairpur [remained inundated](#) until the middle of [November](#). Meanwhile, certain areas of impoverished and predominantly rural Balochistan, where communities have been [calling for help](#) since July, waited months for [assistance](#).

"Initially the floods hit Lasbela, closer to Karachi [in Sindh], so people were able to provide help, but as the flooding spread to other parts of Balochistan the situation became dire," Khurram Ali, general secretary of the Awami Workers Party (AWP), told Peoples Dispatch. "The infrastructure of Balochistan has been neglected, the roads are damaged, and dams and bridges have not been repaired."

The floods precipitated a massive infrastructural collapse that continues to impede rescue and relief efforts—[more than 13,000 kilometers of roads and 439 bridges](#) have been destroyed, according to a November 18 report by the National Disaster Management Authority (NDMA), Pakistan.

Speaking to Peoples Dispatch in September, Taimur Rahman, secretary-general of the Mazdoor Kissan Party (PMKP), said that the government had been "unable to effectively provide aid on any large scale, or to ensure that it reached where it was supposed to go." This has also led to the emergence of profiteering, as gangs seize aid from trucks and sell it, Rahman added.

In these circumstances, left and progressive organizations such as the AWP and PKMP have attempted to fill the gaps by trying to provide people with basic

amenities to survive the aftermath of this disaster.

Cascading Crises

On September 17, the WHO warned of a “[second disaster](#)” in Pakistan—“a wave of disease and death following this catastrophe, linked to climate change.”

The WHO has estimated that “[more than 2,000 health facilities](#) have been fully or partially damaged” or destroyed across the country, at a time when diseases such as COVID-19, [malaria](#), dengue, cholera, dysentery, and respiratory illnesses are affecting a growing share of the population. More than [130,000 pregnant women](#) are in need of urgent health care services in Pakistan, which already had a [high maternal mortality rate](#) even prior to the floods.

Damage to the agricultural sector, with [4.4 million acres of crops having been destroyed](#), has stoked fears of impending mass hunger. In a July report by the World Food Program, 5.9 million people in Balochistan, Khyber Pakhtunkhwa, and Sindh provinces were already [estimated](#) to be in the “crisis” and “emergency” [phases of food insecurity](#) between July and November 2022.

At present, an [estimated](#) 14.6 million people will be in need of emergency food assistance from December 2022 to March 2023, according to the United Nations Office for the Coordination of Humanitarian Affairs. Malnutrition has already [exceeded emergency threshold](#) levels in some districts, especially in Sindh and Balochistan.

Not only was the [summer harvest destroyed](#) but the *rabi* or winter crops like wheat are also [at risk](#), as standing water might take months to recede in some areas, like Sindh. Approximately [1.1 million](#) livestock have perished so far due to the floods.

This loss of life and livelihood has taken place against the backdrop of an [economic crisis](#), characterized by a [current account deficit](#) and [dwindling foreign exchange reserves](#).

Then came the International Monetary Fund (IMF).

As part of its attempt to resume a stalled [\\$6 billion bailout program](#) with the fund, Pakistan’s government [imposed](#) a hike in fuel prices and a rollback on subsidies in mid-June.

“The conditions that the IMF placed on us exacerbated the inflation and cost of living crisis,” explained Rahman. “They imposed on Pakistan tax policies that would try to balance the government’s budget on the one hand, but on the other really undermine the welfare of the people and cause such a catastrophic rise in the cost of living that it would condemn millions of people to poverty and starvation.”

By the end of August, the IMF had approved a [bailout of more than \\$1.1 billion](#). By then, Pakistan’s consumer price index had [soared to 27.3 percent](#), the highest in nearly 50 years, and [food inflation increased to 29.5 percent](#) year-on-year. By September, prices of vegetables were [up by 500 percent](#).

“We went to the IMF for \$1.1 billion, meanwhile, the damage to Pakistan’s economy is at least \$11 billion,” said Rahman. The figure for the damages caused due to the floods now stands at [\\$40 billion](#), according to the World Bank. “The IMF keeps telling us to lower tariff barriers, to take away subsidies, to liberalize trade, make the state bank autonomous, to deregulate private capital and banking, and to balance the budget,” he added.

“The ax always falls on the most vulnerable,” Rahman said. “Over half of the budget, which in itself is a small portion of the GDP, goes toward debt repayment, another quarter goes to the military and then there’s nothing left. The government is basically bankrupt.”

“The advice of the IMF is always the same—take the state out, let the private market do what it does. Well, look at what it has done: it has destroyed Pakistan’s economy. ... Imposing austerity at a time when Pakistan is coping with such massive floods and the economy is in freefall is the equivalent of what the British colonial state did during the Bengal famine—it took food away.”

Pakistan will be forced to borrow more money to pay back its mounting debt, all while IMF conditions hinder any meaningful recovery for the poor and marginalized. The fund has now imposed [even tougher conditions](#) on Pakistan to free up \$3.5 billion in response to the floods, not nearly large enough to address [\\$30 billion](#) worth of economic damage. The [conditions](#) include a hike in gas and electricity prices as well as cuts in development spending.

It is in this context that activists are [demanding](#) a total cancellation of debt, and climate reparations for Pakistan.

The Global North Must Pay

Between 2010 and 2019, 15.5 million Pakistanis were [displaced](#) by natural disasters. Pakistan has [contributed](#) less than 1 percent to global greenhouse gas emissions, but remains at the forefront of the climate crisis.

Delivering the G77 and China's opening statement at COP27, Pakistan's Ambassador Munir Akram [emphasized](#), "We are living in an era where many developing countries are already witnessing unprecedented devastating impacts of climate change, though they have contributed very little to it..."

"Enhanced solidarity and cooperation to address loss and damage is not charity—it is climate justice."

In its February report, the UN Intergovernmental Panel on Climate Change [acknowledged](#) that "historical and ongoing patterns of inequity such as colonialism" have exacerbated vulnerability to climate change. Yet, even as the Global South faces an existential threat, the Global North actively impedes efforts toward redressal.

"Reparations are about taking back [what] is owed to you," environmental lawyer Ahmad Rafay Alam told Peoples Dispatch. "As the climate crisis grows... this discourse [of reparations] is going to get stronger. It's not just going to come from Pakistan, we will hear it from places like Afghanistan where people don't have the infrastructure and are freezing in the winter... We'll hear it as the Maldives and the Seychelles start sinking."

While this struggle plays out globally, there is also justifiable anger within Pakistan over the government's [failure to](#) prepare for the crisis, especially in the aftermath of the [deadly floods](#) of 2010.

"Everyone anticipated that this monsoon would be disastrous, and the National Disaster Management Authority had enough time to prepare," Ali said. "However, there is nothing you can find that [shows what] the NDMA did to prepare for these monsoons. In fact, they do not even have a division to take precautionary measures."

Holding the government accountable for its lack of preparedness, which might have contained the damage, is crucial, Alam said. However, given the sheer scale

of the impact of the climate crisis on the Global South, talking about adaptation has its limitations. As Alam stressed—“There is just no way you can adapt to a [100-kilometer lake](#) that forms in the middle of a province.”

Activists are drawing attention to [infrastructure projects](#) the state is pursuing, and how they put the environment and communities at risk. “As reconstruction takes place it is important not to repeat the mistakes of the past,” Alam said.

“The projects that are affecting riverbeds and other sensitive areas are the development projects themselves,” Ali said. He pointed out that development often takes place on agricultural or ecologically sensitive land such as forests, adding to the severity of future crises.

“It is a very dangerous situation now because imperialist profit-making is devastating the climate, affecting regions that are already maldeveloped. We are living under semi-feudal, semi-colonial conditions in Pakistan, with a strong nexus between the imperialist powers and the capitalists, all making money off our misery,” Ali stressed.

“We have no other option but to fight these forces; there is no other option but a people’s revolution.”

The Fed’s Response To Rising

Inflation Protects The Wealthy At Workers' Expense

Robert Pollin - Co-Director of the Political Economy Research Institute (PERI) at the University of Massachusetts, Amherst

The specter of inflation is haunting the world's economies. Surging prices since 2020, especially in food and energy, have eroded global living standards, though inflation varies considerably across countries. However, inflation is hitting the working class and lower-income people harder than wealthier households, triggering protests around the world, especially in countries with strong trade unions and left-wing political parties. In Europe, governments fearful of social unrest have spent hundreds of billions of euros in an attempt to cushion the impact of inflation. The conservative government in Greece has even sought to restrain the increase in prices in more than 50 basic goods with a "[household basket](#)" plan. Meanwhile, in the United States — the richest country in the world — government policies to assist those suffering disproportionately from the surge in prices do not even exist.

Why are prices rising, and why do experts think that high inflation isn't going away anytime soon? Moreover, what type of policies would we expect from a truly progressive government in an effort to curb inflation and bring wages in line with inflation?

Two leading leftist economists from the University of Massachusetts at Amherst,

Gerald Epstein and Robert Pollin, shed light on these questions in this exclusive interview for *Truthout*. Epstein and Pollin are also co-directors of the Political Economy Research Institute (PERI) at UMass-Amherst, which on [December 2-3 will host an international conference](#) to explore the causes of inflation and what can be done about it.

C.J. Polychroniou: Bob, the war on Ukraine has not only set back global recovery from the COVID-19 pandemic but also seems to have caused inflationary expectations to soar. Indeed, inflation is haunting most economies around the world, and there seems to be no end in sight for high prices. Why is inflation rising, and what are the main forces behind the creation of large price increases in food, the energy sector and even in housing?

Robert Pollin: Sharply rising inflation rates emerged throughout the world coming out of the 2020-2021 COVID lockdown. [According to the International Monetary Fund](#), the average inflation rate for the overall global economy rose from 3.8 percent in 2019, the year prior to the COVID pandemic onset, to 6.4 percent in 2021, as lockdown conditions from COVID started loosening, and 9.1 percent as of October 2022. For the large high-income economies (G-7 economies), inflation rose from 1.6 percent in 2019 to 5.6 percent in 2021 and to 6.8 percent as of October 2022. The comparable figures for the U.S. economy specifically are 2.1 percent in 2019, 7.4 percent in 2021 and 6.4 percent as of October 2022.

Clearly, the first driver of inflation globally has been the unique economic conditions globally coming out of the COVID lockdown. In particular, the global economy emerged out of the lockdown with supply shortages for a wide range of goods, including oil, food and computer chips, since production of goods had been cut back sharply during the lockdown. On top of that, the shipping industry itself contracted during the lockdown, and has [not been able to bounce back quickly](#). Within the U.S., a major drag has been that there has been, very simply, a shortage of truck drivers to deliver supplies. This has resulted because truck drivers are badly paid. Under COVID conditions, the job also became less safe. One easy solution here would be to raise the pay and improve the safety precautions for the drivers. More people would then want to show up and take these jobs. That still hasn't happened. Russia's invasion of Ukraine led to further global supply shortages, in particular for energy and food. This in turn created still more inflationary pressures.

Right-wing commentators like to claim that large government spending levels caused inflation. This position is not entirely wrong, though it is misleading in the way that the right-wing pundits present it. In fact, government spending levels to counteract the COVID lockdown were historically unprecedented throughout the world, amounting to between [15 percent and 30 percent](#) of all economic activity in all major economies. These were government spending levels equal to, if not greater than, World War II. They succeeded in creating a global floor on overall demand — that is, people did still have money in their pockets and bank accounts even while unemployment was spiking with the economic lockdown.

The 2 percent inflation target has primarily been a means of keeping workers' bargaining power weak and enabling profits and CEO pay to explode.

In other words, overall demand did not fall as much as overall supply. This created a version of the classic mantra on inflation, as resulting from “too much money chasing too few goods.” But consider this problem relative to the alternative that would have resulted under the COVID lockdown in the absence of these government spending injections — i.e., “too little money and too many goods.” That would have produced a major *deflation* — i.e., falling prices, wages and incomes, along with huge increases in mass unemployment, bankruptcies and a global depression. I have lots of criticisms of the specific ways in which these COVID bailouts were executed. But we are far better off as a result of this government spending, even recognizing how inflation has followed, than to have allowed a global deflation and depression to result.

Under these circumstances of COVID-lockdown and war-related supply shortages, corporations in turn seized the opportunity to mark up their prices and pad their profits margins. Focusing on the U.S. economy, the *Financial Times* [reported](#) on November 28 that, “Margins of retailers and wholesalers have exploded in the past two years. The basic story here is that a combination of broken supply chains, rising input costs, and high demand created pricing power for producers, who raised mark-ups. Those mark-ups ... are fueling inflation.” The economist Josh Bivens at the Economic Policy Institute has [confirmed](#) this pattern for the U.S., calculating that 54 percent of the price increases for corporations has been due to rising profit margins.

Polychroniou: Can inflation in today's world be controlled by the actions of national governments? If so, what might a progressive government in the United

States be able to do to make prices go down, or otherwise, to increase benefits and wages in line with inflation?

Pollin: The first issue to consider here is how much we should need or want prices to come down. In a paper that I will be presenting at the PERI conference, my coauthor Hanae Bouazza and I show that, considering 130 countries over the 61-year period from 1960-2021, economies have consistently grown at faster rates when inflation ranges between 5 percent and 15 percent as opposed to between 0 percent and 2.5 percent. Generally, this is because when an economy is operating at a high level of activity — with low unemployment rates and strong public sector support — inflation will tend to be somewhat faster. This is not a serious problem as long as workers' wages and living standards are at least keeping pace with inflation. And as I noted above, this is a far less serious problem than when unemployment is high and wages and living standards are eroding, even while inflation may be at 2 percent or less.

In fact, since the mid-1990s, all high-income countries have been operating under what is termed an "inflation targeting" policy framework. These economies have all set their "inflation targets" at 2 percent inflation. The premise here is that economies perform better when inflation is negligible to nonexistent. But in fact, we have seen in the U.S. that, along with low-to-zero inflation between the early 1990s until the COVID reopening, the buying power of workers' wages remained stagnant, while the pay for corporate CEOs rose exorbitantly, from being 33 times higher than the average worker in 1978 to [366 times higher in 2019](#). This is a more than [tenfold increase](#) in relative pay for corporate CEOs. So, the 2 percent inflation target has primarily been a means of keeping workers' bargaining power weak and enabling profits and CEO pay to explode.

Accelerating inflation was harming the real value of wealth held by the top 1 percent and richer strata. The Fed responded by significantly raising interest rates to slow inflation and to try to protect the wealth of the wealthy.

Within this context, it is not surprising that the primary response of policy makers to the global inflationary spike has been to try forcing their economies' inflation rate down to the 2 percent target rate. Specifically, this has entailed central banks raising the short-term interest rates that they control for the purpose of weakening overall demand in the economy and raising mass unemployment. With mass unemployment rising, worker bargaining power — and along with it, the

labor costs faced by businesses — would be expected to decline. Federal Reserve Chair Jerome Powell acknowledged these policy aims clearly, if demurely, in a major speech last August. Powell predicted then that there would “very likely be some softening of labor market conditions” resulting from the Fed raising interest rates.

Despite this singular focus by the Fed and other central banks on raising interest rates and unemployment, this is by no means the only policy tool available that could effectively manage inflation. The Biden administration itself has proposed enacting windfall profit taxes and stricter enforcement of regulations already in place to control corporations monopolistic pricing power. These would counter the excessive mark ups over costs that corporations have been able to impose over the past two years. Additional policy tools could include direct controls in the short term of some key prices, such as oil, along with tighter enforcement of speculation trading on futures markets for oil and food. Still more, increasing infrastructure investments can serve to loosen supply-chain bottlenecks in the short run while raising productivity over the longer term. Advancing a green energy transition — including investments in both energy efficiency and renewable energy — will reduce dependency on volatile fossil fuel markets while also driving down CO2 emissions.

It is possible that these other measures do not operate as forcefully as raising interest rates and unemployment for bringing inflation down to the 2 percent target rate. But the evidence shows that it is not typically necessary to force down inflation to such low levels. Moreover, all of these alternatives offer the critical advantage that they can reduce inflationary pressures without forcing up unemployment rates. It is also critical to note that inflation has been coming down since July. In the U.S., the average rate for the past four months has been [2.7 percent](#) (expressed on an annual basis). At the least, this pattern demonstrates that there is no further need for the Fed to continue trying to force up unemployment in the name of inflation control. Rather, the combination of less stringent inflation-control policies should be more than sufficient now to continue bringing inflation down to an acceptable level.

Polychroniou: Jerry, there are some economists who argue that monetary policy has been the neglected factor behind the recent surge in inflation. Is this a valid argument, especially with regard to inflation in the United States? Moreover, how do central banks control inflation, and how do you assess the role, so far, that

central banks and the Fed in particular have played in combatting inflation? It appears that working-class people, globally, are getting the short end of the stick with the policies pursued by central banks in the fight against inflation.

Gerald Epstein is Professor of Economics and a founding Co-Director of the Political Economy Research Institute (PERI) at the University of Massachusetts, Amherst.

Gerald Epstein: The Federal Reserve has two broad areas of responsibility: one is with regard to monetary policy and the second involves financial regulatory policy, which includes both the monitoring and enforcement of financial regulations. When it fails to implement or enforce its regulations sufficiently, then it bails out the financial institutions and markets that have engaged in reckless behavior and are teetering on the edge. Here it is playing its role as “lender of last resort” or more accurately, as the “bailor-in-chief.” To bail out these banks and markets, the Fed tries to keep interest rates very low so they can borrow money cheaply. This also gives banks and wealthy financiers the opportunity to borrow money cheaply and buy and trade financial assets, leading to the massive increases in financial wealth we have observed until recently in the period following the great financial crisis of 2007-2009. Up until the time when Russia invaded Ukraine, the Federal Reserve’s mixture of monetary policy, regulatory (non-) policy and bail-outs led to a gigantic “asset inflation,” but not much of an inflation in the cost of goods and services. The one exception to this may have been in the case of housing and real estate, whose increase in prices were probably partly driven by these low interest rates.

But when supply chain problems from the pandemic hit and Russia's invasion took hold, then commodity inflation took off. Now the Fed saw that its game of inflating the wealth of the wealthy with low interest rates and bailouts would no longer suffice. The problem: The accelerating inflation was harming the real value of wealth held by the top 1 percent and richer strata. The Fed responded by significantly raising interest rates to slow inflation and to try to protect the wealth of the wealthy. But as Bob Pollin explained, this came at the expense of slower employment growth and even higher unemployment for workers.

As Bob explained, the standard of living of workers and the poor have been significantly hurt by increases in the cost of living associated with the war and supply problems, but higher interest rates, designed to help the wealthy, will only hurt the workers more. Home mortgage costs, interest rates on credit cards and slower wage growth will be the result.

Polychroniou: Assuming you were in a position to affect policymaking in the fight against inflation, what measures would you recommend as an economist of the left?

Epstein: Since Bob discussed this in general, I will focus here on what the Federal Reserve *could* do. It is often said that the Fed has only one tool — interest rates — and so that is what it is using to fight this inflation. But this is not correct. As the Fed amply showed during the great financial crisis and the onslaught of the COVID pandemic — as well as in previous periods such as during World War II — the Fed has a number of tools in addition to interest rates: these include subsidized lending, asset buying, direct lending for productive purposes, and other more technical tools like asset-based reserve requirements designed to subsidize some lending and penalize other types. If the Fed had the notion (and the political will to pull it off in the face of a potentially hostile Congress), it could lend subsidized credit or buy assets from specialized nonprofit banks devoted to providing low-cost housing; it could provide working capital or buy longer term assets from organizations in communities providing subsidized solar energy and insulation for residences and community buildings; it could provide subsidized credit for farmers and rural communities that are producing healthy food and developing distribution networks that bypass the mega-middle men — buyers, grocery stores etc. that are using their market power to rise food prices. These are just a few examples.

The point is that the Federal Reserve has a huge amount of creative lending and investment strategies during the recent crises mostly to help banks and other financial institutions, but also municipal governments, small businesses and the like, and they could do this again to do two things: Help subsidize key commodities for the working class and poor, and also help increase the supply of key commodities — green energy, healthy food, etc. — that will improve the standard of living of workers in the medium to longer term.

Punishing increases in interest rates are not the only tool the Fed can use, but it is the tool it is choosing.
